

Q.34 - Advanced Concept Map Substitution method

Q33 - Advanced Concept map: Master Theorem

Time Complexity Result

Simplified analysis of recursive algorithms

Justification

The map begins with divide and conquer, which creates recursive subproblems. These subproblems produce a recurrence relation. The master theorem then compares the recursive work $n^{\log_b a}$, with the additional work, $f(n)$. This comparison determines whether case 1, case 2, case 3 applies.
